Making and Storing Colloidal Silver

Making your own colloidal silver is very simple but follow the directions carefully.

ITEMS TO PURCHASE and STORE FOR FUTURE USE:

- Purchase DISTILLED WATER.
  Note: Spring water is not the same as distilled water. You must use distilled water.

- 9 volt batteries . . . For possible bio-terrorism emergency preparation, I would recommend that you store a minimum of three to six batteries for every person in your household. Distilled water is very inexpensive. I would recommend two or three gallons of distilled water be stored for each member in the household.

ATTACHING THE BATTERIES:

1. Attach three 9V batteries together in series. See attached diagram.
   Note: Do not attach both terminals of two batteries together as this is a direct short and will quickly ruin the batteries.

2. Hook wire leads to the two remaining battery clips.

GENERATING PROCEEDURE:

1. Place two drops of salt water in a large glass. Note: do not use plastic containers with colloidal silver because it reacts with the colloidal silver and weakens it.

2. Fill the glass to within about ½” of the rim with distilled water.

3. Place the silver prongs into the glass opposite one another. They must not touch.

4. Clip 27v. electric leads from batteries (three 9v. batteries hooked in series).

5. Generate for fifteen minutes for approximately 15 ppm (15 part per million). This is a recommended amount for ingesting or taking internally. This water will turn cloudy . . . this is normal.

6. For external use, you can make a much stronger solution . . . generate for approximately 25 to 30 minutes. This can be used on cuts and wounds. Several drops of this stronger mixture can also be placed in a gallon of water to kill unwanted bacteria that would be found in a mountain stream. Shake the water and let it sit for a minimum of five minutes before drinking.

   Note: If the safety of the water is in question, use a much larger amount of stronger colloidal silver mix. Shake and allow to set for a longer period of time so that any dangerous bacteria is destroyed.

7. Mix the solution with a wood or plastic spoon . . . never insert metal objects into the solution.

STORING COLLOIDAL SILVER:

Light affects colloidal silver so it should always be stored in a dark bottle or kept in a dark place. If necessary, wrap duct tape around a glass container or place a class container inside a dark cabinet. Never store Colloidal Silver in direct sunlight.
Do not refrigerate . . . try to keep it at a comfortable room temperature. Long term storage is not recommended by most researchers. Make it fresh at least once or twice weekly.

CLEAN UP OF THE SILVER ELECTRODES:

You can wipe most of the dark buildup from the silver electrodes with a paper towel. Periodically wipe the probes with a course fabric scrubber in order to regain silver brightness. Make sure that your electrical clips do not touch . . . 9v batteries do not last very long if the clips are allowed to touch during storage.

ADDITIONAL SILVER or SALINE WATER:

You can purchase additional silver from most jewelry workers supply stores such as Maroon Bells at 3400 Tejon Street in Denver. I try to use 3/16” or ¼” flat fine silver. There are also a number of silver supply stores in Gallup, New Mexico, because of the use by Navajo silversmiths.

The salt water should be made from sea salt which is available at most health food stores. Mix approximately one teaspoon salt in the two ounce bottle. Always use distilled water treated with colloidal silver for making the salt water in order to keep it fresh.

PROLONGED USE OF COLLOIDAL SILVER:

The periodic drinking of 10 or 15ppm colloidal silver does not cause toxic build-up in the body. If prolonged use of colloidal silver is necessary because of a serious health issue or incident of bioterrorism, it is important to consume yogurt or an acidophilus supplement in order to replace the good bacteria in your digestive system.

LIMITATIONS OF COLLOIDAL SILVER:

There is no doubt that Colloidal Silver seeks out and destroys harmful bacteria but Colloidal Silver cannot bolster the immune system. It is a natural antibiotic not a nutritional supplement. Research has shown that the necessary nutrients needed by the body to build and maintain a healthy immune system are no longer available in the modern diet. Soils have been depleted because of failure to follow Biblical mandates to allow the soil to rest every seven years. Fruits and vegetables are harvested green in order to ship them and store them for market consumption. To make matters even worse, our food supplies are subjected to toxic preservatives, and when we finally get the vegetables, we cook them until there is absolutely no nutritional food value left.

The society is literally suffering from nutritional starvation even as our bellies are filled and bloated from foods that ruin our health. Researchers and governmental health officials recommend 6 to 8 servings of fruits and vegetable a day plus nutritional supplements. The fact is, vitality and wellness are not attainable from the foods we eat.

Recent research in the area of glycobiology has revealed that there are eight essential glyco proteins that are needed by the human body to generate a healthy immune system. Of these eight complex carbohydrates, only two are found in the American diet and they are the two that make us fat instead of healthy! You can get more information about glycobiology by searching the web.

Volumes have been written about the benefits of colloidal silver. Research the subject thoroughly. We recommend that you read -- “COLLOIDAL SILVER: A Special Report by Dr. Alex Duarte, O.D., PH.D.” or the book – “THE MICRO SILVER BULLET” by Dr. Paul Farber, available at (800) 748-5619.
